

# June 3<sup>rd</sup>, 2015 Update

Jack Matteucci

# Run 5/27

- MC Pressure Scans:
  - ER at 0.325 mTorr, MC from 0.22 to .70 mTorr
  - ER at 0.530 mTorr, MC from 0.43 to 1.36 mTorr
    - Net Power at 100 W for pressure scans
- Net Power Scan
  - 8 W to 160 W
    - ER at 0.350 mTorr, MC at 0.64 mTorr

For all scans, Main Mag = 92A, Nozzle = 300 A

# Conditions:

- MC pressure: 0.69 mTorr
- ER pressure: 0.354 mTorr
- Satellite:  $1.6 \times 10^{-5}$  Torr
- Net Power: 139 W,  $p_{\text{forward}}$ : 170W,  $p_{\text{refl}}$ : 31 W
- 27 MHz helicon power
- $R = 0.0$  cm
- Bias from  $\sim -120$  V to  $\sim 65$  V
- Nozzle 300 A, Main 92 A

IV CharacteristicNet Power = 139.0 W

# 2<sup>nd</sup> derivative of Current w/ respect to V

IV CharacteristicNet Power = 139.0 W

Probe Current vs Voltage

# Sqrt Ion sat approximation

# Constant Ion sat approximation

# MC 0.69 mT, ER 0.354 mT, 139 W

# MC 0.69 mT, ER 0.354 mT, 160 W

MC 0.69 mT, ER 0.354 mT, 38 W

MC = 0.43mT, ER = 0.530 mT, 100 W

Temp: ER at 0.325 mTorr, MC from 0.22 to .70 mTorr

High Temp: ER at 0.325 mTorr, MC from 0.22 to .70 mTorr

Density: ER at 0.325 mTorr, MC from 0.22 to .70 mTorr

# Conclusions:

- Temp shown to be constant until 0.4 mT at which point it jumps up 10% from 4.5 to 5 eV
- High temp shown to fall with MC pressure until 0.4 mT at which point it is not affected.
- Density found to depend on density although no trivial relationship.

Temp: ER at 0.530 mTorr, MC from 0.43 to 1.36 mTorr

High Temp: ER at 0.530 mTorr, MC from 0.43 to 1.36 mTorr

Density: ER at 0.530 mTorr, MC from 0.43 to 1.36 mTorr

MC = 1.36 mTorr

Sqrt fit attempts:

# Constant Fit (MC = 1.36 mTorr)

# Conclusions:

- Odd drop in density after MC = 1.2 mTorr – shown to rise until this point
- High temp and temp are both shown to fall with an increase in pressure.

Temp:

Power scan: 8 W to 160 W, ER at 0.350 mTorr, MC at 0.64 mT

High Temp:

Power scan: 8 W to 160 W, ER at 0.350 mTorr, MC at 0.64 mT

Density:

Power scan: 8 W to 160 W, ER at 0.350 mTorr, MC at 0.64 mT

# Conclusions:

- Odd drop in density and Temp at 50 W, not observed in high temp distribution
- Temp and density rise before this drop, then fall with more power after drop (temp may begin to climb again after 100 W)
- High Temp varies by 2 eV but shows consistent trend of growing with power

# E sat and I sat FFTs

Main:  
135 A

# Total FFT

120 W

0 kHz      2 kHz      4 kHz

160 W

# Stray Capacitance

- Measured at 257 pF
- For Sine wave, amplitude  $A \sim 75$  V,  $f \sim 500$  Hz
- $\text{Max}(dV/dt) = 2 \cdot \pi \cdot A \cdot f = 2.4 \cdot 10^5$
- $C \, dV/dt = I = (2.57 \cdot 10^{-10}) \cdot 2 \cdot \pi \cdot A \cdot f$
- $= 6 \cdot 10^{-5}$  amps
- Note: Ion saturation current consistently found to be  $10^{-5}$  to  $10^{-4}$  amps.
- Solution: use sawtooth wave- subtract away contribution, or real time setup probe not connected to plasma, measure signal and subtract away.

# Potential Summer Projects

- Investigate sweep frequency dependence in langmuir characteristic measurements
  - If this is solely caused by stray capacitance, perform study as to how to obtain clean signal
  - Very possible (from grad lab) that not solely due to stray capacitance, could have interesting physics at play
- Create lab view program/ system to obtain time dependent langmuir characteristics
